The effect of chronic ethanol ingestion on spontaneous locomotor activity and anxiety-like behavior in mice was examined in this study. Ethanol exposure from 6-20 weeks of age increased the time spent in the center of the open field. In contrast, ethanol exposure did not alter the spontaneous locomotor activity at 2 or 5 months of age. The responses to stress and novelty, which are negatively correlated to anxiety, were also not affected by ethanol exposure. These data indicate that ethanol enhances the emotional valence of anxiety-like behavior in the open field.
