The following overview of the architecture of the Autodesk Applications is from the Autodesk Developer Network: Processes and Objects The following class diagram, based on Autodesk's Developer Network, is from AutoCAD's Help menu, and is explained here. According to the class diagram, there are many processes, and each process can contain one or many objects. An object is used to represent the same thing at different points in time. The following is an explanation of each of the processes shown in the class diagram: `__modifylayers` The process `__modifylayers` is the constructor and destructor of a group that handles Layers. It takes the active object as a parameter and returns that object. `__setModification` The process `__setModification` contains a public function that is called before and after the object is modified. `__setModification` also takes an active object as a parameter and returns the updated object. `__callFileName` The process `__callFileName` contains a public function that calls the property `FileName`, which stores the file name of the file opened by the active object. `__newobjects` The process `__newobjects` contains a public function that opens a file and returns the modified object. `__closeFile` The process `__closeFile` contains a public function that closes a file. `__wndCalls` The process `__wndCalls` contains a public function that contains the Window calls of a group. It takes an active object as a parameter and returns the modified object. `__documentCalls` The process `__documentCalls` contains a public function that contains the Document calls of a group. It takes an active object as a parameter and returns the modified object. `__layerCalls` The process `__layerCalls` contains a public function that contains the Layer calls of a group.
